This invention describes novel polynuclectides that encode protein

markers and fine chemical-production proteins from Corynebacterium
glutamicum. The polynucleotides are isolated from a nucleic acid library
of C. glutamicum then mutated at the specified positions, cloned and
expressed by standard methods. Cella, especially Corynebacterium
cexpressed by standard methods. Cella, especially Corynebacterium
cexpressed by standard methods. Cella, especially Corynebacterium
cexpressed by standard methods. Cella, especially Corynebacterium
cerpressed by standard methods. Cella, especially Corynebacterium
cerpressed by standard methods. Cellas, preferably amino acids and specifically
corynebacterial more generally nucleotides, nucleosides, lipids, fatty acids,
diols, carbohydrates, aromatic compounds, vitamins, co-factors and
charmaceutical industries. The polynucleotides, optionally as primers
corpressed are used for identification and classification of corporation and related species, e.g. for diagnosis, for genomic mapping,
functional or evolutionary studies, gene manipulation and modulation of
cerpresented in the printed specification but is sequence is not
cerpresented in the printed specification but is available in electronic
corporativity and or more efficiently. NOTE: This sequence is not
corporative transportation but is available in electronic
corporation and produce fine their record has been obtained from
corporation and produce fine chemicals in this record has been obtained from

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the examplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        fine chemical production; lysine production; nucleotide; nucleoside;

                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                           18
                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA sequence data for this patent did not form part of the printed specification, but was obtained in electronic form part of the from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel polynucleotides derived from Coryneform bacteria, for identifying

The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, saccharides and organic acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel biochip comprising probe spots, each containing many identical probes. The probes are nucleotide sequences of 30.80 bases, are prepared ex situ from synthetic oligonucleotides and at least one includes a segment of at least 20 bases identical with, or complementary to, a segment of an open reading frame (orf) of Escherichia coli K12. The biochip is used for specific detection of gene expression if X12 and for determining the gene expression pattern, e.g. for diagnostic determination of which E. coli strains are present in the gut, and to determine the effects of e.g. growth media on gene expression. The biochip provides as comprehensive as possible detection of the K12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Biochip containing probes complementary with open reading frames in Escherichia coli K12, useful for detecting gene expression and expression
mutation point of a gene, measuring expression of a gene, analyzing expression profile or pattern of a gene and identifying homologous gene.
                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 349980 BP; 80289 A; 91081 C; 97378 G; 81232 T; 0 U; 0 Other;

genome, with simultaneous analysis of many different genes with a single device, and comparison of gene expression between K12 and its mutants or other E. coli strains in a single experiment. Apart from qualitative and quantitative information about gene expression, it also allows measurements of population densities for the various strains. The use of synthetic oligonucleotides for preparation of probes allows free synthetic nin probe length and ensures high purity (and thus selectivity, reactivity and reproducibility); also synthetic probes are generally shorter than probes prepared by polymerase chain reaction. patterns.

This invention describes a novel biochip comprising probe spots, each containing many identical probes. The probes are nucleotide sequences of 10-80 bases, are prepared ex situ from synthetic Oligonucleotides and at least one includes a segment of at least 20 bases identical with, or complementary to, a segment of an open reading frame (orf) of Escherichia complementary to, a segment of an open reading frame (orf) of Escherichia (in K12 and for determining the gene expression pattern, e.g. for diagnostic determination of which E. coli strains are present in the gut, and to determine the effects of e.g. growth media on gene expression. The biochip provides as comprehensive as possible detection of the K12 and to determine the effects of e.g. growth media on gene expression. The genome, with simultaneous analysis of many different genes with a single device, and comparison of gene expression between K12 and its mutants or other E. coli strains in a single experiment. Apart from qualitative and quantitative information about gene expression, it also allows measurements of population densities for the various strains. The use of synthetic oligonucleotides for preparation of probes allows free

methods for the analysis of sequence variations including nucleic acid polymorphisms and mutations.

Example 4; SEQ ID NO 33; 198pp; English.

used to demonstrate The specification describes the use of fragmentation-based methods and systems including mass spectrometric methods for the analysis of sequence fradiations including mucleic acid polymorphisms and muctations. The fragmentation-based methods and systems of the invention are useful for the analysis of sequence variations including nucleic acid polymorphisms and muctations. The methods are useful for identifying agentic disease or chromosome abnormality; identifying a predisposition to a disease or condition including obesity, atherosclerosis, or cancer; identifying an infection by an infectious agent; providing infection cleaning to identify, heredity, or histocompatibility; identifying pathogens; or determining haplotypes. Apqi6353-ApQi6361 represent Bordetella variable 16S rRNA gene regions. Amplicons from this regionwere used to demon the invention. They were used to demonstrate a method for bacterial rention. They were used to demor by base-specific fragmentation. typing

Amplicons from this regionwere used to demonstrate the invention. They were used to demonstrate a method for bacterial typing by base-specific fragmentation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The specification describes the use of fragmentation-based methods and systems including mass spectrometric methods for the analysis of sequence variations including mucleic acid polymorphisms and mutations. The fragmentation-based methods and systems of the invention are useful for the analysis of sequence variations including nucleic acid polymorphisms and mutations. The methods are useful for identifying a genetic disease or chromosome abnormality; identifying a predisposition to a disease or condition including obesity, atherosclerosis, or cancer; identifying an infectious agent; providing information relating to identity, heredity, or histocompatibility; identifying pathogens; or determining haplotypes. ADQ1633-ADQ16316 represent Bordetella variable

The present sequence is one of 3351 sequences in a library of human polymucleotides. The library is used to detect differentially expressed genes correlated with a cancerous state of a mammalian cell and can detect colon, prostate, breast and lung cancer. The library can be used to produce probes for detection of mRNA and to produce additional copies of the polymucleotides. The probes can be used for chromosome mapping of the polymucleotide and for detection of transcription levels. Ribozymes or antisense oligonucleotides can be generated. The polymucleotides and their gene products are used as genetic or biochemical markers (e.g. in blood or tissues) that will detect the earliest changes along the carcinogenesis pathway and/or monitor the efficacy of therapies and antibodies against them can be used in pharmaceutical compositions to treat the cancers and proliferative disorders such as neoplasia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

Clones are derived from the human BAC library RPCI-11. For BAC
library availability, please contact Pieter de Jong
(pleter@dejong.med.buffalo.edu). Clones may be purchased from
BACPAC Resources (http://bacpac.med.buffalo.edu/ordering_bac.htm)
or from Resear h Genetics (info@resgen.com). BAC end Web Server:

Oligo-dr track not found, Not I site shown in beginning of sequence is likely internal to the message. cDNA Library Preparation: M.B. Soares Lab Clone distribution: Researchers may obtain BMAP cDNA clones from RESEARCH GENETICS. It should be noted that Bento Soares is generating a small number of additional specialized non-redundant arrays of BMAP cDNAs whose availability will be considered under appropriate and limited collaborative arrangements The tissue for this library was contributed by Dr. Xin-Yuan Fu, Yale University School of Medicine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 598 bp mRNA linear EST 03-APR-2003 cDNA clone ce--0261, mRNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Site 2: Not I; The library was constructed according Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. Denatured RNA was afize fractionated on a 1% agazose gel. First strand cDNA synthesis was primed with oligo-dT primer containing a Not I site. Double strand cDNA was size selected according to mRNA size fraction, ligated with ECOR I adaptor, digested with NotI and then cloned directionally into pXX-Asc vector. The library tag sequence located between the Not I site and the polyA tail is AATAATTACG. This library was created for the University lows Brain Anatomy Project (BMAP): 'Gene Discovery in the Developing Mouse Nervous System', supported by National Institute of Mental Health (NIMH)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CDNA Library Preparation: Life Technologies, Inc.

/clone lib="Triticum aestivum High-cot"
/note="Corgan: Seedling; Vector: PCR4-TOPO; Wheat genomic DNA was Sheared to fragments averaging about 1.8 kb,
denatured and then reassociated in phosphate buffer at 650C. After a given cot value was reached, aliquots were tun through a hydroxyapatite (HAP) column in order to separate single stranded DNA from double stranded DNA. The slighes thanded DNA was then converted to a double stranded form with one round of Klenow DNA polymerase treatment with random 6-mer primers. The double-stranded fragments were then further size-selected through a column and cloned into the PCR4-TOPO vector"

An Arabidopsis full-length cDNA library was constructed essentially
an Exported previously (Seki et al., 1998). cDNA cleaved with BamHI
and Khol was ligated to modified Lambda FLC-1 vector (Carninci et
al., submitted for publication) digested with BamHI and Sall. This
clone is in a modified pBluescript vector. Please visit our web
site (http://www.gsc.riken.go.jp/e/plant/index_e.html) for further

/clone=root transition zone from young plants
/clone=trand clone was prepared from poly4+ mRNA
using SuperScript lasmid System Kit (Invitrogen). The
double-strand cDNAs were fractionated in a sepharose
CL-28 40cm-columns and fragments sizing between 0.8 and
1.5 Kb were directionally cloned into the vector. Details
of each source of RNA and library construction can be
obtained at http://sucest.lad.ic.unicamp.br/public"

The threshold for high quality sequence is 20. Three-prime sequences, which are obtained with PolyTMix or T7 sequencing primer, are presented as the reverse complement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /mol_type="mRNA"

/ lab_host="E. xoli SIGE 2: XNO!; Plants were grown in the greenhouse. Anthers were harvested and pooled from early meiosis to late meiosis. The tissue, total RNA, and poly(A) RNA were prepared (Butler, Ross and Gustafson) at University of Missouri, Columbia. A cDNA library was made, and the cDNA clones were in vivo excised to give pBluescript phagemids in the TV Close lab (Choi, Close, Fenton) at the University of California, Riverside.
Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors)."
/clone_lib="1000 - Unigene I from Maize Genome Project"
/note="This library represents the unique ESTs found in
the first round of EST sequencing at Stanford University
for the maize genome project. Sequences are present from
libraries 486, 487, 496, 603, 605, 606, 614, 618, 660,
libraries 77, 707, and 945. Contigs were assembled using
TIGK's CAP program and a representative EST from each
contig was selected for the Unigene set. All singlets were
also selected."

; Sequence 27, Application US/08976259
; Patent No. 6316609
; GENERAL INFORMATION:
APPLICANT: Dillon, Patrick J.
APPLICANT: Welch, Rodney A.
TITLE OF INVENTION: Nucleotide Sequence of Escherichia coli
Patent No. 6316609
NUMBER OF SEQUENCES: 142.
CORRESPONDENCE ADDRESS:
ADDRESSEE: Sterne, Kessler, Goldstein & Fox P.L.L.C.
STREET: 1100 New York Ave, N.W., Suite 600
CITY: Washington
STATE: DC
COUNTRY: USA
ZIP: 20005-3934

Sequence 14603, Application US/09252991A

Patent No. 655175

GENERAL INFORMATION:
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TILLE REPERENCE: 109196.136
CURRENT FILING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR PILING DATE: 1999-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NOS: 33142
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GENERAL INFORMATION:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            유
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 27, Application US/09956004

Sequence 27, Application US/09956004

Patent No. 6787643

GRENERAL INFORMATION:
APPLICANT: Patrick J. Dillon et al.
TITLE OF INVENTION: Nuclectide Sequences of Escherichia coli Pathogenicity Islands
FILE REFERENCE: PB33401

CURRENT PLILIG DATE: 2001-09-20

PRIOR PILING DATE: 2004-09-20

PRIOR PILING DATE: 1997-11-21

PRIOR PLILING DATE: 1997-11-21

PRIOR PLILING DATE: 1997-10-14

PRIOR PLILING DATE: 1997-10-14

PRIOR PLILING DATE: 1996-11-22

NUMBER OF SEQ ID NOS: 142

SOFTWARE: PatentIn version 3.1

SEQ ID NO 27
